Personal Budget Management System Report

Project Budgetwise
Student Ainemukama Alfred
Course unit UI/UX Design
Date 31 October 2026

Introduction

Budgetwise helps users record income and expenses and see the amount remaining each month. The main journey is Login, Budget dashboard, Add transaction and Updated summary. The interface is built with HTML, CSS and JavaScript.

User research

The research focused on the tasks involved in managing a personal budget: recording money received, adding everyday expenses and checking the remaining balance. The intended users are students, salaried workers and people with irregular income.

The task analysis identified a need for quick entry, clear UGX amounts, monthly totals and feedback after saving. Summary cards make the monthly position visible. Labelled fields and an income or expense switch make the entry form easier to follow.

Problem statement

When income and expense records are kept in different places, it is difficult to see how much money remains. Budgetwise brings the entries together and calculates monthly totals automatically.

Main requirements

• Sign in using an email address and password.

• See monthly income, expenses and remaining balance.

• Add income or an expense with a description, amount, date and category.

• Show clear errors for missing or incorrect information.

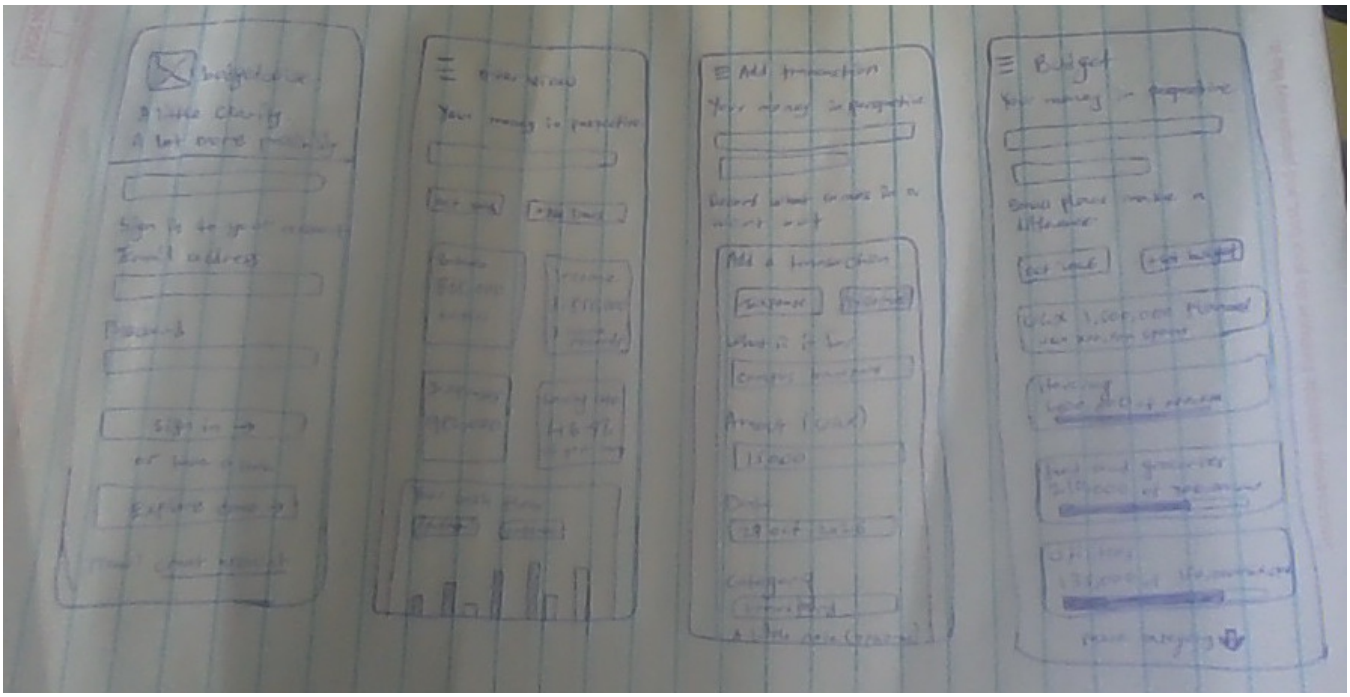

• Update the summary after saving and keep entries after reloading.

• Provide readable forms and easy navigation on a phone.

Design ideas and sketches

A transaction list is useful for checking individual records. A dashboard makes the overall monthly position easier to see. The design uses a dashboard first and keeps detailed records on a separate Transactions page.

Low fidelity wireframes

Hand-drawn sketches showing Login, Dashboard, Add transaction and Budgets.
The sketches organise the fields, summary cards and main buttons before the high fidelity design. The form groups related information, while the dashboard places the monthly totals near the top.

High fidelity mobile design

The Figma designs show Login, Overview, Add transaction and Updated summary. Repeated buttons, fields and cards give the screens a consistent appearance.

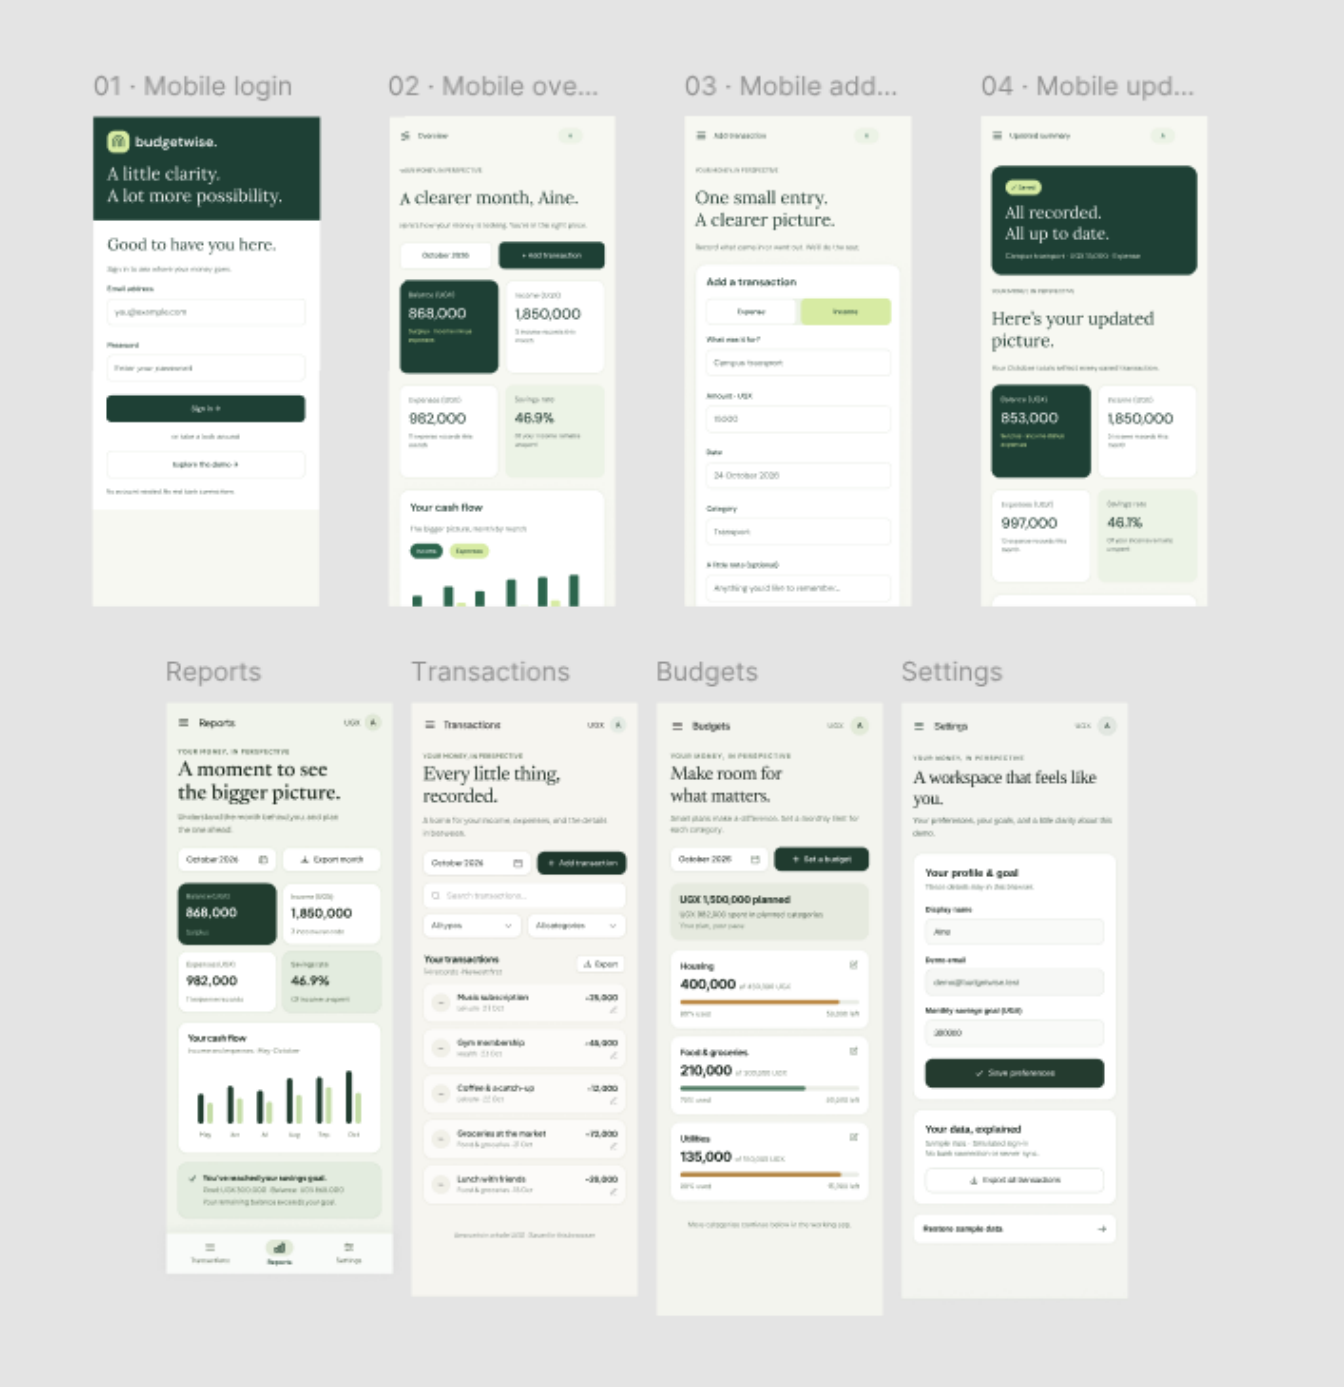

Dark green is used for the brand and main actions. Light backgrounds separate the cards from the page. DM Sans is used for body text and numbers, while Lora is used for main headings.

High fidelity mobile designs

The Figma screens show the main user journey and the supporting pages. Consistent colours, typography, cards and buttons connect the screens.

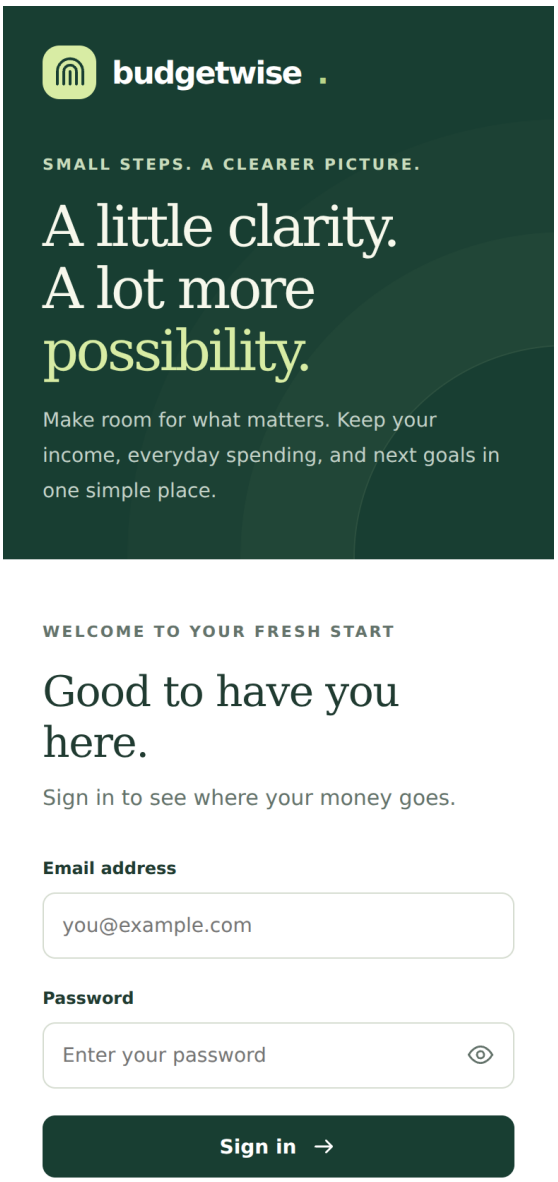

Mobile screens: Login, Overview, Add transaction, Updated summary, Reports, Transactions, Budgets and Settings.

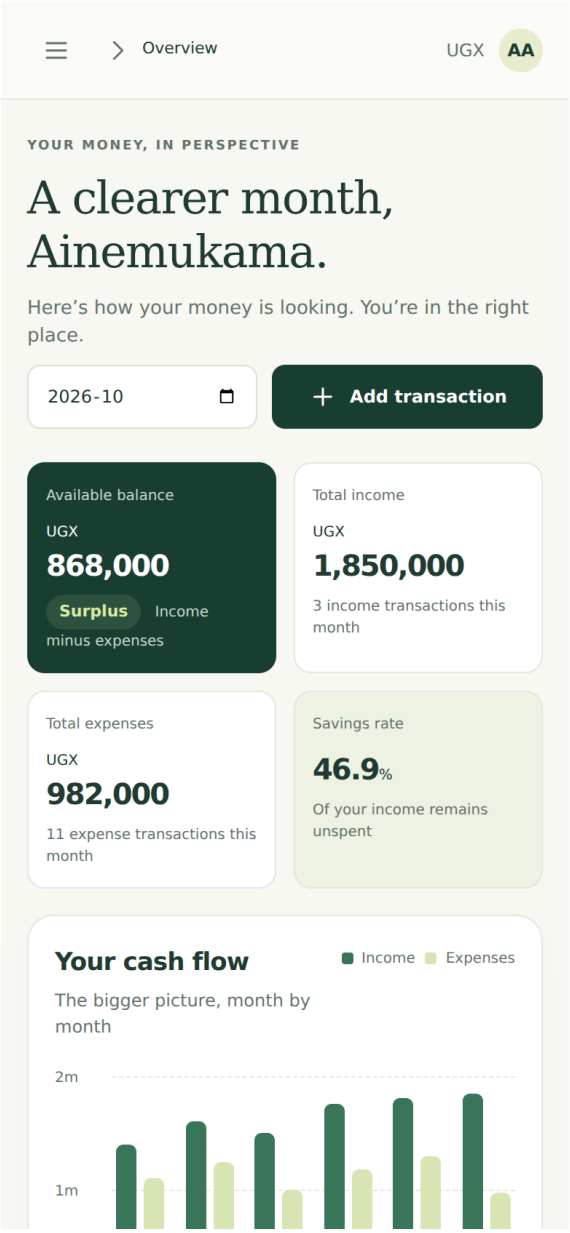

Mobile login and dashboard

The login form accepts the configured account without showing its details. After sign-in, the dashboard displays the selected month and the main financial totals. The Add transaction button starts a new entry.

Login

Budget dashboard

The dashboard begins with income of 1,850,000 UGX, expenses of 982,000 UGX and a balance of 868,000 UGX. Labels, visible amounts and consistent spacing help users read the information on a phone.

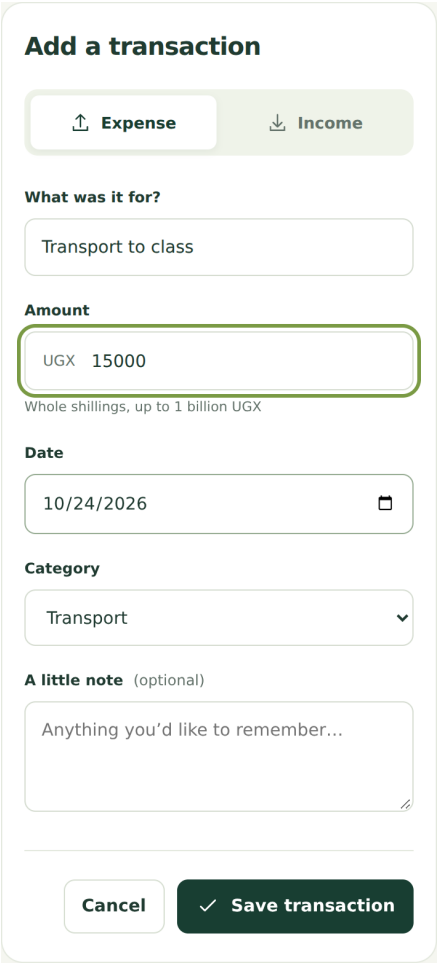

Implementation

HTML loads the interface. CSS controls the appearance and responsive layout. JavaScript handles navigation, validation, calculations and browser storage.

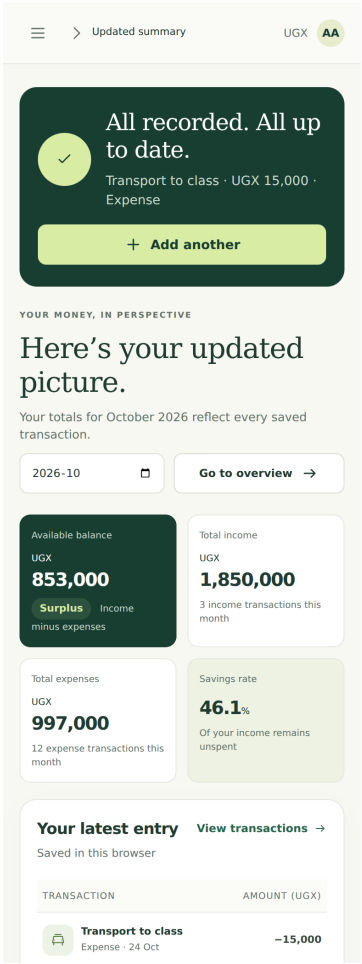

Mobile transaction and summary

The form records the type, description, amount, date and category. A note is optional. The balance preview shows the effect of the entry before it is saved.

Add transaction

Updated summary

Saving a 15,000 UGX transport expense changes the totals as follows. Balance is calculated by subtracting expenses from income.

Item	Before saving	After saving
Income	1,850,000 UGX	1,850,000 UGX
Expenses	982,000 UGX	997,000 UGX
Balance	868,000 UGX	853,000 UGX

The mobile checks covered empty fields, incorrect login details, transaction validation and saved totals. Reloading retained the entry. The layout was checked at widths of 320 and 390 pixels.

Conclusion Budgetwise provides a clear journey from sign-in to an updated monthly summary, supported by hand-drawn sketches, mobile designs and a working interface.
